MEYLE-HD slot bushing kit with tool

Defective bushings at the BMW rear control arm usually mean one thing at the workshop: the entire control arm needs to be replaced, which is expensive for the workshop and driver. Hamburg manufacturer MEYLE now offers an economical and eco-friendly solution: comprising the pre-compressed, ready-to-install MEYLE-HD slot bushings and the corresponding installation tool, the kit enables targeted replacement of bushings in selected BMW 5 Series, 6 Series, 7 Series and X5 models. A real innovation, which was awarded with the Innovation Award in the Repair & Maintenance category at Automechanika Frankfurt 2018.

MEYLE has developed a specialised tool to ensure seamless installation and removal of the bushings. The MEYLE-KIT offers workshops a comprehensive package with the ready-to-install slot bushings and tool – there's nothing comparable in the aftermarket¹. The bushings are already precompressed to installation size and enclosed in an installation sleeve, which ensures optimal insertion of the slot bushing and thus a perfect fit inside the control arm.

On top, the MEYLE solution comes with enormous cost-savings: on average, the kit costs less than a tenth of the two OE control arms¹, which always have

to be replaced entirely. Another detail makes the precompressed bushing especially user-friendly: because the installation sleeve is longer than the bushing, the tool is guided during insertion, preventing the tool from slipping off. Produced with high energy, the aluminium body of the control arm can be used again, with any waste associated with the use of the repair solution limited to a few rubber and aluminium parts.
